

$h(a) = 4$, but $h^*(a) = 1$

expansions: s ($f = 2$), b ($f = 1 + 1 = 2$), γ ($f = 3 + 0 = 3$)

a stays in OPEN with $f = 1 + 4 = 5$ and is never expanded
returned (blue): $s \rightarrow b \rightarrow \gamma$, cost 3

optimal (orange, dashed): $s \rightarrow a \rightarrow \gamma$, cost 2
