

both at v at time t

each agent planned alone:
shortest paths that meet

root: no constraints
conflict $\langle a_1, a_2, v, t \rangle$

add $\langle a_1, v, t \rangle$
replan a_1 only

add $\langle a_2, v, t \rangle$
replan a_2 only

high level: best-first search on the sum of costs
low level: space-time A^* for one agent under its constraints
