

$h = \text{grid distance to } (1,3)$, so $f(s) = f_{\min} = 3$

dashed: shortest path, cost 3, $f = 3$,
one conflict with B at $(1,1)$, $t=1$

solid: wait once, cost 4, $f = 4$,
no conflict

$w = 1$: $\text{FOCAL} = \{f = 3\}$, dashed path returned

$w = 1.5$: $\text{FOCAL} = \{f \leq 4.5\}$, solid path returned;
both runs return the lower bound $f_{\min} = 3$
